## Frame & Railing Finishes

### Standard: Super durable frame & railing finishes:

The anti-graffiti, super durable polyester TGIC finish, is a powder that is applied 6-9 mils thick then cured at 400 degrees until fused into a smooth glossy permeate coating. This coating meets AAMA 2604-2 specifications and has a much longer life expectancy than the industries standard TGIC. This anti-graffiti coating provides an outstanding finish.

The smooth glossy surface can withstand numerous cleanups with the use of our proprietary chemical cleaner without altering the finish. Paint and marker can be removed completely with only a slight reduction in gloss.

The architectural matte, super durable polyester TGIC finish, is a powder that is applied 6-9 mils thick then cured at 400 degrees into a smooth matte permeate coating. This coating meets AAMA 2604-2 specifications and has a much longer life expectancy than the industries standard TGIC.

### Premium Frame & Railing Finish (up charge)

A 2-3 mil thick zinc rich primer is applied prior to a final standard color coat. This premium finish enhances the ability of your structure to combat even the harshest environments and has withstood over 10,000 hours in our salt/fog test chamber. This primer prevents rust from forming and spreading in the event of nicks and scratches in the color coat, providing the ultimate in pre-finished steel structure coatings.
